New Idea on Incorporation of Activated Carbon in Urethane Foam

Your January 23, 1961 note describing this new idea passed over my desk recently. I would like to point out that the disclosure is fine as far as it goes, but I felt it was too limited. Subsequently, I talked with Claud, and he told me that you had asked for additional information and ideas pertaining to other applications for this activated charcoal paint.

To insure that all of the ideas to which this paint is applicable are recorded, I would like to include the following in full realization that these may be a duplication of Claud's own ideas. As a matter of record, some of these ideas are not original with me but were mentioned at a recent project review meeting on the subject of filter development held on January 17, 1961. The ideas are as follows:

1. For use on cellulose acetate tow.
2. For use with non-woven fabrics.
3. For use as a painted strip applied to the plug wrap or mouthpiece paper during normal filter making and combining operation.
4. For use as a simple, practical, and novel means of preparing what appears to be a dual filter construction yet embodies only a single filter plug with controlled addition of an activated carbon.

If you have questions concerning any of the above ideas and/or the inventor, it might be wise to consult with Mr. A. P. Super who may have recorded much of this conversation during the project review meeting.
